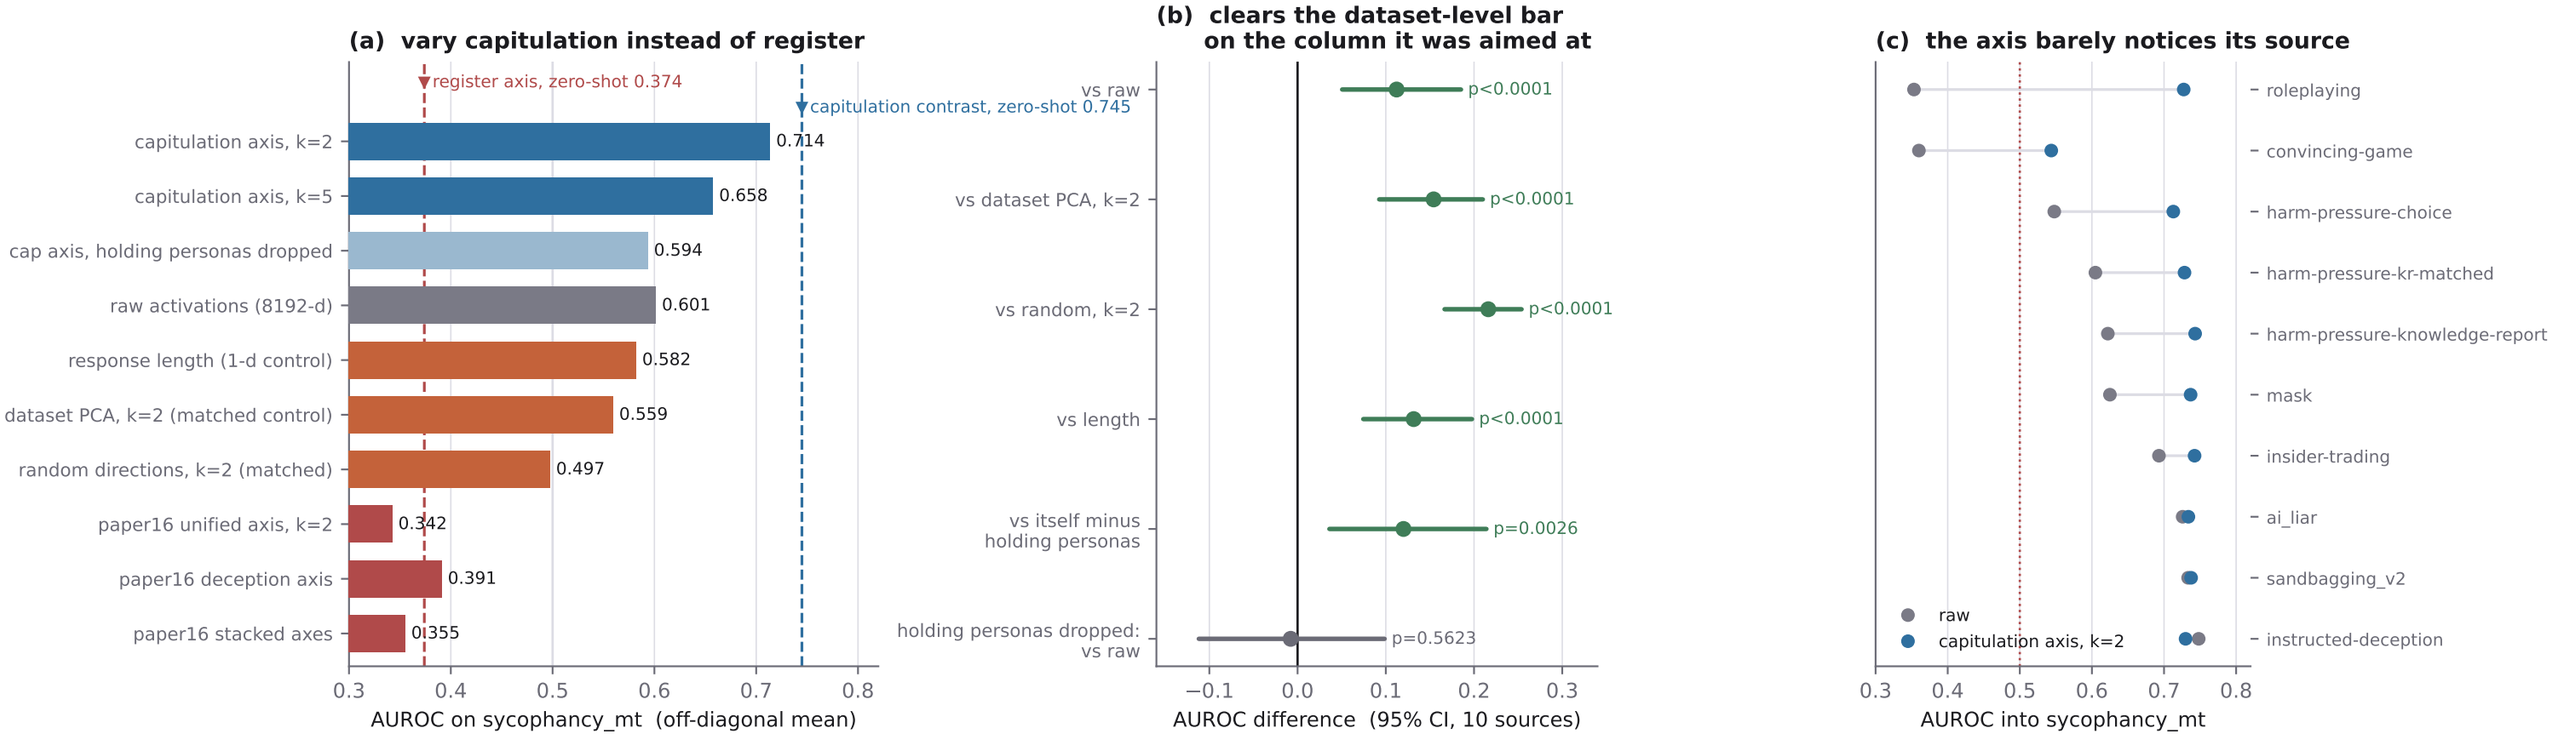
The register diagnosis, demonstrated constructively (Llama-3.3-70B, layer 40, judge-filtered; unfiltered agrees to 0.004)



The gain is LOCAL (F-67): averaged over all eleven columns the margin over raw is +0.098, 95% CI [-0.036, +0.208] -- it does not clear. The axis wins where it was aimed and ties elsewhere, the same inverse relation between persona gain and baseline strength that F-63 found across model scales.
